Energy and Air Pollution

Dr. Timur Gül

Wuppertal, 07 September

World Energy Outlook Special Report
Context

- **Air pollution is the fourth largest human health risk**
  - 3.5 million premature deaths are linked to energy poverty due to the use of biomass for cooking and kerosene for lighting
  - 3 million premature deaths are linked to outdoor air pollution, mostly in cities

- **Many of its root causes – and cures – are in the energy sector**
  - The majority of air pollutant emissions comes from the energy sector, mainly from fuel combustion
  - Currently only 8% of global energy production is combustion free: more than half of the rest has no effective technology in place to control emissions
  - No country in the world has solved the air pollution problem completely, but many are taking important policy steps

- **Can the energy sector step up efforts to combat this global public health crisis?**
Air pollution is an energy problem

Energy is the single most important cause of emissions of all main pollutants

Pollutant emissions, 2015

- **Nitrogen oxides** (NOX)
  - 108 Mt
  - **Oil**: 61%
  - **Coal**: 43%

- **Sulfur dioxide** (SO2)
  - 81 Mt
  - **Coal**: 43%

- **Fine particulate matter** (PM2.5)
  - 41 Mt
  - **Biomass**: 43%

High risk air pollution areas

Mortality rate due to air pollution, 2012

Countries with the largest death toll are China and India, but on a per capita basis many countries across Africa, Asia and Eastern Europe are affected.
The death toll keeps rising...

Premature deaths due to outdoor pollution in selected regions

Despite planned policies premature deaths increase from 3 to 4.5 million in 2040
...although action is being taken in many parts of the world

Policies are successful to decouple pollutant emissions from energy demand growth to 2040; but the air pollution problem remains far from being solved
What should the energy sector do?

The IEA proposes a pragmatic strategy to cut pollutant emissions & deaths by around 50%, compared with our main scenario.

A Clean Air Scenario, based on existing technologies & tailored to local conditions, relies on actions in three areas:

1. A long-term air quality goal

2. A package of clean air measures for the energy sector:
   - An **accelerated energy transition**: more efficiency & more renewables
   - More widespread use of **advanced pollution controls**

3. **Strict monitoring & enforcement** and effective **communication**
A 7% increase in investment can save over 3 million lives in 2040, while providing energy access for all, lower energy import bills and leading to a peak in CO₂ by 2020.
The IEA Clean Air Strategy

Improvement in cooking methods, 2040

715 million households

Electricity & natural gas

Improved solid-fuel cookstoves

LPG

Premature deaths from indoor air pollution

Lives saved in the Clean Air Scenario

 Millions

A 7% increase in investment can save over 3 million lives in 2040, while providing energy access for all, lower energy import bills and leading to a peak in CO₂ by 2020
The Clean Air Scenario meets the renewables and efficiency goals of the Sustainable Development Goals by 2030.
A Clean Air Strategy helps reducing energy-related CO₂ emissions, but more efforts are needed to put the world on track for 2 °C.
Conclusions

- The impacts of air pollution are concentrated in fast-growing Asia & in Africa, but no country has solved the problem entirely

- The overall death toll still rises, despite post-COP decarbonisation policies & targeted pollution measures that mitigate pollution trends

- IEA’s Clean Air Strategy cuts 2040 pollutant emissions & premature deaths by around half, with only a 7% increase in investment

- A well-designed air quality strategy will have major co-benefits for other policy goals, including energy access & climate change

- WEO-2016 revisits the low-carbon transition: the “well-below-2 °C” target, stranded assets, renewables economics & integration, ...
